

cpssculptures - Language Manual.

1/All there is Feelings and Objects. When the self perceives an Object or deduces a Feeling, the Memory of the perception of an Object is a Basic Object, and the deduction of a Feeling becomes a Basic Feeling. If one does not remember the Feeling or Object, they cease to exist for the person in question. Basic Feelings and Basic Objects are called The Objects. Then the Basic Object transmutes into an Object Object, and the Basic Feeling transmutes into Feeling-Logic Objects. Object Objects and Feeling-Logic Objects are called Memory Objects. The Basic Objects and the Memory Objects are the base for the Word Layer. The three Layers, The Objects, the Memory Objects, and the Word Layer are called the Word

Layer. The Word Layer is the basis for the Language Grammar Layer.

3/We designate The Objects, Object Objects and Feeling-Logic Objects and the Memory Objects, Object Objects and Feeling Logic Objects and the Word Layer as the Word Layer. I use the name Word Layer twice as I cannot see a way around this.

4/The Memory Objects are Memories of Objects. The Objects are the Memories of Objects and Feelings. The Memory Objects are the base for Words. In the Word Layer, we have the Objects, the Memory Objects, and Words. Usually, Words designate Feelings of the Memory Objects. We think in the Feelings of the Memory Objects. The Word Layer can be interpreted by the Language-Grammar Layer. Language Grammar is the Base for Thought. Example; The sound symbol of the Word “it” represents the Feeling of “it”. The Feeling of “it” is a Memory Object. The Memory Object Feeling of “it” is the memory of the Basic Feeling of “it”. Basic Feeling cannot change, but the memory of the Basic Feeling can change. The memory of a Basic Feeling is called a Feeling-Logic Object.

4a/We think in Memory Objects. Memory Objects being memories of The Objects. Memory Objects are denoted by Words.

5/Basic Objects>Object Objects>Words and Basic Feeling>Feeling-Logic Objects>Words create the Word Layer.

6/The Memory Object Layer contains the Base for all Words. The Word layer can be interpreted by the Language-Grammar Layer.

7/When we look at Words, we can go back to the Basic Object or Basic Feeling or to the Object Objects or Feeling-Logic Objects for the Path. The path can be for words can be

Basic Objects>Words, Basic Feelings>Words,
 Object Object>Words, Feeling-Logic
 Objects>Words or Basic Objects>Object
 Objects>Words or Basic Feelings>Feeling-
 Logic Objects>Words.

8/Basic Objects>Object Objects include
 memories of Physical Object including Pain
 and Emotions. Basic Objects are perceived
 by the Senses. Pain and Emotion Basic
 Objects are in the Dynamic Filter Noun Coral
 Path and are called Adjectives and are a
 Filter in the Dynamic Filter Nouns. The path
 is Basic Object>Object
 Objects>Nouns>Adjectives.

9/Memory Objects are denoted by Sound
 Symbols called Words. The Word Layer

contains all Words in Language, and the Words denote Memory Objects.

10/The first Set is Basic Feelings and Basic Objects, The Objects. The second Set is the Memory Objects including the Object Objects and Feeling-Logic Objects. The third Layer is the Words. The first three Layers create the Word Layer, and Word Layer is the base of the Language-Grammar Layer. Basic Feelings and Basic Objects are the Memories of Feelings and Objects. Feelings and Objects are fairly irrelevant if we do not remember them.

11/The word sound symbol of “it” in the Word Layer represents the Basic Feeling of “it”. The Path for “it” can be written in a few ways. Basic Feeling>it. Feeling-Logic Word>it. Basic Feeling>Feeling-Logic Object>it. Basic Feeling>Feeling-Logic Object>Indicator Word>Portal Word>it. Indicator Word>it, Portal Word>it. Indicator Word>Portal Word>it.

The Word Layer.

12/The Basic Objects>Memory Objects and Basic Feelings>Memory Objects are the base for Words. The Objects >Memory Objects>Words. The Word Layer is the base for Language and Grammar called the Language Grammar Layer.

13/The Word Layer is the first Major Layer, and the Language-Grammar Layer is the second Major Layer.

14/The two Major Layers are called The Word Layer and the Language-Grammar Layer. The first layers are The Objects, Memory Objects and the Word Layer, and these three Tiers are called the Word Layer. The first Major Layer is called the Word Layer, and the second Major Layer is called

The Language Grammar Layer. The Language Grammar Layer is about the phenomena of Word relationships.

15/The Basic Feelings and Basic Objects are The Objects. The Objects are the base for Memory Objects. Object Objects and Feeling-Logic Objects are called Memory Objects. The Objects and Memory Objects are the Base for The Word Layer. These three Tiers are called the Word Layer, we think in Memory Objects.

16/With Language Grammar Layer we can interpret Words with Filters. There is Dynamic Filters and Filters, there may be optional Sub Filters, but I have not made any yet.

17/With the Dynamic Filters I use an upgrade of the old system based on Nouns, Verbs and Adjectives. With the new system, there are Dynamic Filters - Nouns, Verbs, Logic Words, and Indicator Words. Dynamic Filters Nouns, Verbs, Logic Words and Indicator Words are a new system for a Description of Words. Dynamic Filters break down into The Filters.

18/The Filters are subordinate to their respective Dynamic Filter. Verbs Dynamic Filter that has no Filters attached except

Verbs. Logic Words have Filters called Logic Words, and Gerunds. The Nouns, and Indicator Words Dynamic Filters have sets of filters described below.

19/ Adjectives is a Filter used in the new system to describe Emotions and Pain in the Noun Dynamic Filter. Nouns are based on Basic Objects that have been Transmuted into Object Objects. Object Objects are a base for Noun Words. The Path for Adjectives is Basic Objects>Object Objects>Noun>Adjective or Nouns>Adjectives, Basic Objects>Adjectives.

20/The Dynamic Filters are Nouns, Verbs,
Logic Words and Indicator Words.

Descriptions of Dynamic Filters and Filters.

The **Dynamic Filters** with their Filters are as follows.

Nouns - All Nouns can be used as Gerunds and Verbs.

Common Noun

Co Noun

Proper Noun

Persona Noun

I object

Adjective

Logic Words -

Logic Words

Gerunds

Verbs -

Verbs

Indicator words -

Portal Words

Finite Words

21/The Dynamic Filters with their **Filters** are as follows.

Nouns - objects perceived through the senses.

Common Noun

Co Noun

Proper Noun

Persona Noun

I object

Adjective

Logic Words are from deduced feelings.

Verbs are like the inverse of Logic Words.

Gerunds are in the Dynamic Filter Logic Words and Gerunds are the Logic of a Noun. Gerunds are in Logic Word Dynamic Filter as Gerunds.

Gerund is a Logic Word made from a Noun base. The word “Runner” Gerund is made from the Noun “Runner”. Gerund Filter is in the Logic Word Dynamic Filter. Runner can be used as Logic Word, Noun and Verb as per Plastic Language Concept.

Complimentary Word is a Logic Word which relate to a Noun but are not Gerunds. Two Complimentary Words are “runs” and “running”. Runs and running are Complimentary Words as they are indirectly related to a Noun. Runner being a Noun with Running and Runs indirectly related. Complimentary words are really Logic Words so there does not need to be a Filter Complimentary Words. As **Complimentary Words** are **Logic Words** and the words fit into the **Logic Word Filter** we do not need a **Complimentary Word Filter**. Logic Words

related indirectly to a Noun in principle. I hope to prove this in the Language Grammar Layer through the Language Structure Concept. Runs and running are Logic Words.

Verbs - Verbs are Describing Words and are like the inverse of Logic Words.

Verbs - The only Filter for Verbs is Verbs

Indicator Words - Are Words that have no relationship with the senses and Indicate directions for Language Objects.

Portal Words - Portal Words, indicate Language Objects but not Finite Words, or Verbs. Numbers are also Portal Words.

Finite Words - Indicate space-time relationships for Language Objects (Nouns and Logic Words) but do not indicate space time relationships for Verbs.

22/Logic Words are deduced from Nouns directly or indirectly. Verbs are like the inverse of Logic Words. Logic Words>Gerunds is a Filter in the Dynamic Filter Logic Words.

23/Gerund is a Logic Word made from a Noun base. e.g.: “runner” is a Gerund as the word can be used as Logic Word but also can be used as a Noun. As per Plastic Language Concept, “Runner” should all so be able to be used as a Verb, a describing word.

26/Verbs - Verbs are describing words and are like the inverse of Logic Words. Verbs can be used as Logic Words.

28/Indicator Words - Are Words that have no relationship with the senses and Indicate directions for Language Objects.

29/Portal Words - indicate Language Objects but not Finite Words or Verbs.

30/Finite Words - Indicate space-time context for Language Objects.

24/Nouns are a Basic Object>Object Object>Nouns.

25/Logic Words - Basic Feeling>Feeling-Logic
Object>Logic Words,

Verbs - Basic Feeling>Feeling-Logic
Object>Verbs

Indicator Words. Basic Feeling>Feeling-Logic
Object>Indicator Words.

30/I call Verbs Inner Words and are derived
from Logic Words.

31a/Logic Words have a relationship with
Nouns. I call Nouns and Logic Words Outer
Words. I call Verbs and Indicator Words
Inner Words as they have no real Substance.
As they are just descriptions based on Logic
Word experience. Language Objects are the
same as Outer Words based on reality.

31/Logic Words based on Nouns and have Substance. I call Nouns and Logic Words Outer Words. When we are talking about Language Grammar I call Outer Words Language Objects as Language Objects have substance and can be the subject in sentences and are based on the senses. Verbs are not really the substance of a sentence. Verbs describe Language Objects.

32/In the Plastic Language Concept, Words can move around the Dynamic Filters, Noun, Logic Word and Verb. E.G. "Runner" can be a Noun, Logic Word or Verb.

33/The Dynamic Filter Indicator Words are not interchangeable with the other Dynamic Filters Words.

34/Logic Words are Outer Words based on external reality while Verb being Inner Words that have no real Substance. Verbs are just descriptions. One cannot really talk about descriptions. One talks about Language Objects. Language Objects are another name for Outer Words. We could say we talk about Outer Words, called Language Objects.

35/We do not talk about Inner Words like Verbs. We do not talk about Verbs which are Descriptive Words. We do not talk about Descriptions. We talk about Language

Objects. Language Objects is another name for Outer Words.

36/Verbs are a part of the Noun, Verb, and Logic Word Triad and are incorporated into the Plastic Language Concept. Words used in Plastic Language are Nouns, Logic Words, and Verbs. Only the Words in the Dynamic Filter Indicator Words are not used in the Plastic Language Concept. The Plastic Language Concept describes the relationship of Nouns, Logic Words and Verbs. This relationship between Nouns, Logic Words is that words can change Dynamic Filters in the Language Word Triad.

37/While Verbs are in the Noun, Logic Word and Verb Triad they are also Inner Words.

38/Inner Words being Verbs and Indicator Words.

39/Inner Words are directly from the Self. Verbs really say what we see. Verbs describe Outer Words sometimes called Language Objects. Indicator Words indicate directions for Outer Words or Language Objects.

40/Plastic Language concept describes the phenomena of the Noun, Logic Word and Verbs Triad. Dynamic Filters can swap for the different words in the Nouns, Logic Words and Verbs Dynamic Filters. I do not include Indicator Words in the term Plastic Language. The Term Plastic Language is a general term to describe the relationship of words in the The Triad. Noun, Logic Word and Verb Triad Words relationship is described with Plastic Language Concept. Plastic Language is perceived through Language Structure.

41/Indicator Words come directly from the Self and Verbs also come directly from the Self. Verbs indirectly are from a Basic Objects or the External Reality perceived through the Senses. Verbs, Indicator Words>Finite Words and Indicator Words>Portal Words are also Inner Words and come directly from the I Object.

42/Verbs are directly from the Self. Verbs have an indirect Basic Object in the path where as Indicator Words have no relationship to Basic Object.

43/Logic Words and Indicator Words and Verbs are Feeling Words. Nouns are Object Words. The Word Layer starts with Basic Objects and Basic Feelings. Basic Object are remembered from Objects and Basic Feeling are remembered from Feelings. In general we can say Nouns are based Objects and Logic Words, Verbs and Indicator Words are based on Feeling.

44/Logic Words and Verbs has the Basic Object dropped off the Path and is remembered as a Basic Feeling as they are based on External Reality. Indicator Words has no relationship Basic Objects, I believe. Numbers are probably Protocol Words based in the Internal World of the I Object, or are Inner Words.

45/A Verb use the same Basic Feeling as a Logic Word, most likely.

46/Dynamic Filter Logic Words and Dynamic Filter Verbs have the Basic Object dropped off the Path and are deduced as Basic Feeling Words. Verbs and Logic Words use the same Basic Feeling deduced from remembered Feelings. Indicator Words have no relationship with Basic Objects. Nouns start with the Basic Object in the Path and are directly based on the Senses.

47/Indicator Words are a Internal Words like Verbs. Verbs are show the connection between Outer Words and Inner Words as Verbs indirectly had a Basic Object in the path while being an Inner Words. Verbs are a Inner Words while being in the Noun, Logic Word and Triad. Logic Words and Verbs have had a Basic Object in the Path but Basic Objects do not need to be inscribed in the Path as this does not really matter, except in understanding words. Nouns keep the Basic Object in the Path.

48/Logic Words are different to Verbs as Logic Words are Outer Words and Verbs are Inner Words. This relationship of Verbs and Logic Words to the same Basic Feeling create a indirect relationship between Verb and Logic Words. This is the distinction between Verbs and Logic Words shows the difference between Inner and Outer Words.

49/The relationship between Logic Words and Verbs is exemplified in the Language Grammar Layer. We confirm the distinction between Logic Words and Verbs through the syntax of Language Structure.

50/In the Language Grammar Layer we describe Outer words as Language Objects. Outer Words or Language Objects are Physical Objects that are can be used as Target Objects in sentences. Verbs describe Language Objects. Verbs as Inner Words do not really have substance. They are really only descriptions. Verbs describe Language Objects.

51/Verbs are in the Noun, Logic Word and Verb Triad as Verb have a relationship to Nouns and Logic Words as Verbs are Indirectly related to Objects. The Plastic Language phenomena is where the Dynamic Filters Nouns, Logic Words and Verbs are interchangeable for a word. This is possible because the Words in the Plastic Language are Directly or Indirectly based on Objects or External Reality from the Senses. Indicator Words are not interchangeable and are not a part of Plastic Language Concept and are Internal Words and have no Relationship to the Objects or the Senses.

51a/The relationship of the Plastic Language Concept can be exemplified with Logic Words/Gerunds. Here with Gerunds we can see how Logic Words/Gerund are related Nouns. The word Runner can be a Noun or a Logic Word. And as Logic Words can be Verbs we can see the whole pattern of the Plastic Language Concept.

52/Verbs and Indicator Words are Inner words and do not really have substance, like Outer Words Nouns and Logic Words. Verbs are related to Nouns and Logic Words as they fall into Plastic Language Concept. Verbs are Inner Words like Indicator Words in nature. Verbs do not have substance, they are just descriptions whereas Nouns and Logic Words are experience from the Senses. Verbs describe the experience of Logic Words. Verbs are a projection of

Experience. We describe with Verbs what we experience from a Logic Words.

53/Indicator Words>Finite Words and Indicator>Protocol Words indicate and direct Nouns or Logic Words. Nouns and Logic Words are called Language Objects.

Indicator Words and Verbs do not relate to Nouns and Logic Words in construction even though Verbs and Logic Words Words use the the same Basic Object. The feeling comes in with Logic Word and goes out with the Verb.

53a/Logic Words can be also used in themselves as Logic Words. They do not have to be Description but portray the Experience. We Experience Logic Words were as Verbs Describe the Experience.

54/Verbs are in a relationship to Noun and Logic Words. I call Nouns, Verb and Logic Word relationship the Noun, Verb and Logic Word Triad. The interchangeable relationship of Dynamic Filters of the Noun, Verbs and Logic Words Triad is called Plastic Language Concept.

55/Indicator Words are outside of the Noun, Logic Word and Verb Triad described by the Plastic Language Concept. Verbs and Indicator Words are Inner Words that flow out from the Self. The Verbs are in the Noun, Verb and Logic Word Triad while also being Inner Word coral.

56/Verbs are the connection between Reality and the Self. Inner Words>Indicator Words are not in the Noun, Verb and Logic

Word Triad. Verbs really what we describe is what we experience.

57/Language Objects are the same as Outer Words. Language Objects is a good name for the Noun and Logic Word entities when describing Language Grammar phenomena. Outer Words is a name for Nouns and Logic Words is a good name when understanding Words. Nouns and Logic Words are either called Outer Words or Language Objects.

58/Verbs are Inner Words are indirectly linked to Basic Objects. Verbs may use the same Basic Object as Logic Words but Verbs are Expressed rather than Logic Words

Experienced. Verbs are classified differently to Nouns and Logic Words as Nouns and Logic Words are called Outer Words flow inward to the I Object and Verbs and Indicator Words are classified as Inner Words and flow outwards from the I Object.

59/Is like we experience Logic Words and express the experience through Verbs.

60/Logic Words and Verbs are directly connected to Nouns through Gerunds. So we have Nouns>Gerunds, Logic Words>Gerunds and Verbs>Gerunds.

61/ Descriptions Of Words.

Inner Words

Concepts

Plastic Language Concept.

Language Structure.

62/Language Objects are Nouns and Logic Words and are the bread and butter of Language Grammar and Language.

63/Inner Words>Indicator Words flow out from the Self and do not have Indirect or Direct base from the Nouns. Inner Words>Verbs and Outer Words Logic Words are Indirectly based on Basic Objects. Noun are based on Basic Objects.

64/Path for Inner Words>Verbs is Basic Feeling>Feeling-Logic Object>Verb changes into Basic Feeling>Feeling-Logic Object>Verb. Path for Inner Word>Indicator Words is Basic

Feeling>Feeling-Logic Object>Indicator Words, with no Basic Object ever being in the path the path. Inner Words>Verbs indirectly have a Basic Object as a base whereas Inner Word>Indicator Words have no Basic Object base at all.

Outer Words/Logic Words have the Basic Object dropped from the path once the Basic Object has been Perceived the Path is Basic Object>>Basic Feeling>Feeling-Logic Object>Logic Word. The Basic Object is Deduced into a Basic Feeling creating the new Path Basic Feeling>Feeling-Logic Object>Logic Word. Logic Words i call Outer Words when talking about Words and Language Objects when talking about Language Grammar. In the Language Grammar Layer I hope it becomes more

obvious why I call Language Objects Outer Words while being based on Feeling.

65/A difference between Inner Words>Verbs and Inner Word>Indicator Words is in the Path descriptions Verbs the has the Basic Object dropped from the path whereas Indicator words never had a Basic Object in the path.

66/Language Structure lets AI computer's translate Language accurately. Language structure is very strict other wise AI computer could not translate languages. I use Language Structure to help workout the new Dynamic Filters and their Filters.

Sometimes I think the Language Manual could be a syntax theory as I depend on Syntax or Language Structure a great deal.

67/I use the old system of Nouns, Verbs and Adjectives as a model for the new system of Nouns, Logic Words, Verbs and Indicator Words, though my theory is quite different. A frame work is created from Language Structure for the new system of Nouns, Verbs, Logic Words and Indicator Words.

68/Plastic Language Concept is based on Language Structure of the Noun, Logic Word and Verb Triad excluding Indicator Words.

69/Indicator Words>Finite Words indicate Space-Time dimension to Nouns and Logic

Words called Language Objects.

Indicator>Protocol Words Indicate like a variable for Language Objects and include numbers and mathematic symbols like + - * / called Plus, Minus, Times and Divisions. Any symbol is a Protocol Word. More complicated Protocols are Chess Moves.

71/Adjectives are a Filter in Dynamic Filter Nouns. Adjectives Filter include Pain and Emotion. Nouns flow inward from the Senses. Nouns are the base for Logic Words and Verbs. The Base for Nouns are called Basic Objects. Basic Objects are Based on External Reality from the Self. Pain and Emotions are External Reality from the Self and are designated by Nouns/Adjectives.

72/Dynamic Filter Logic Words are from Basic Object>>Basic Feeling>Feeling-Logic Words>Logic Words with the Basic Object dropped from the Path creating the new Path Basic Feeling>Feeling-Logic Words.

73/Runner can be a Noun, Logic Word or Verb. This phenomena is described Plastic Language and is called the Plastic Language Concept. Plastic Language Concept describes Noun, Logic Word and Verb Triad phenomena.

E.g.

Noun- We need a new runner for our team:

Logic Word- The engine was a good runner:

Verb - The athlete had runner magic.

These examples maybe a little clumsy but they give an idea how Plastic Language works within the Noun, Logic Word and Triad works.

74/The Paths for “Runner” being -

Noun - Basic Object>Object Object>Runner.

Gerund - Basic Feeling>Feeling-Logic Object>Logic Word>Gerund>Runner.

Verb - Basic Feeling>Feeling-Logic Object>Feeling Logic Word>Verb>Runner.

75/Within our common use of Language we can use the Plastic Language Concept and

Noun, Logic Word Triad to help identify and understand the Dynamic Filters and Filters and Words in General.

76/Indicator Words>Protocol Words and Indicator Words>Finite Words are not Nouns or Logic Words. Verbs are not Nouns or Logic Words. Verbs and Indicator Words flow from to the Self and Nouns and Logic words flow to the Self. Verbs use the same Basic Feeling as Logic Words. Verbs are the inverse of Logic Words and are project from the Self. Logic Words flowing in and Verbs flowing out. Logic Words and Verbs are two sides of the same coin.

77/Adjectives are Emotions and Pain in the New System and Adjectives or Emotions and Pain can be called Nouns or more precisely Adjectives. Nouns/Adjectives. Adjectives Pain and Emotions are Physical Objects perceived by the Senses. Adjectives Filter is in the Noun Dynamic Filter and can be described as Nouns. Adjectives are Objects. Adjective can also be used as a Logic Words> Gerunds. Nouns/Adjectives can be Verbs as within the Plastic Language Concept.

78/When an Object has been Perceived The Object is Remembered as a Basic Object by the Self. Adjectives have a base of a Basic Object. The Basic Object transmutes into a Object Object and Object Objects can be denoted by Words. The for Path Adjectives is Basic Objects>Object Objects>Nouns>Adjectives. Adjectives here being a Sub Filter of Nouns. Adjectives have a Basic Object in the Path. The Basic Object for Adjectives can be Deduce into Basic Feeling for Logic Words and Verbs. When the Basic Object for Adjectives is used for Logic Words or Verbs the Basic Object is dropped off the Path. The Basic Object has been Deduced by the Self into a Feeling>Basic Feeling when remembered, not needing the Basic Object any more.

79/Basic Objects are the Base for Nouns, Logic Words and Verbs Words. The path for a Gerund is Basic Object>>Basic-Feeling>Feeling-Logic Objects>Gerund. The Basic Object is dropped from the Path creating Basic-Feeling>Feeling-Logic Objects>Gerund. Gerunds are Feeling Words. So to with Verbs. The path for a Verb is Basic Object>>Basic-Feeling>Feeling-Logic Objects>Verb. The Basic Object is dropped for the Path creating Basic-Feeling>Feeling-Logic Objects>Verb. The Basic Object is dropped from the Path for Logic Words and Verbs. The Basic Object is Deduced into a Feeling creating a Base for Feeling Words. When the Deduced Feeling is Remembered the Feeling becomes a Basic Feeling. A Basic Feeling may have multiple Feeling-Logic Objects associated with the Basic Feeling. Feeling Words are Logic Words, Verbs and Indicator Words.

80/When using Plastic Language Concept a Word in The Noun, Logic Word and Verb Triad the Word can be used in the three Dynamic Filters. The Word can be Noun, Logic Word or Verb. E.g. Love can be a Noun, Love can be a Logic Word and Love can be a Verb.

81/Basic Objects>Object
Objects>Noun>Adjectives, an Object Word can be deduced remembered as Feeling Words Logic Words or Verbs but not as Feeling Words Indicator Words.

Pain,

Noun- The pain was immense.

Verb - The pain time was long.

Logic Word - I thought he was a real pain.

82/Emotions are Basic

Objects/Nouns/Adjectives and Emotions can be felt in extremes. Logic Words as sensations. Inner Words Verbs and Indicator Words have no physical Feeling.

83/Basic Feeling>Feeling-Logic Words>Verbs and Basic Feeling>Feeling-Logic

Word>Indicator Words maybe stimulate the nervus system but really have no feeling.

They maybe interpreted by Adjectives.

Adjectives are Nouns - Emotions and Pleasure/Pain.

84/Basic Feeling>Logic Words is Basic

Object>>Basic Feeling>Feeling-Logic

Object>Logic Words. I drop Basic Object from the path as has been superseded by the Basic Feeling in the path.

85/Verbs, Basic Object>>Basic Feeling>Feeling-Logic Object>Verb. The Basic Object from the path as has been superseded by the Basic Feeling in the path.

86/Indicator Words, Basic Feeling>Feeling-Logic Object>Verb. The Basic Object was never in the Path.

88/A path is never Basic Object>Object Object >Basic Feeling. Paths start either with a Basic Feeling or Basic Object.

89/Words either Feeling Words or Object Words. The Paths start with either Basic Feeling or Basic Object when the Feeling or Object is remembered.

90/Nouns can be used as Gerunds, Basic Object>>Basic Feeling>Feeling-Logic Object>Logic Word>Gerund. The Basic Object is dropped from the path and has been superseded by the Basic Feeling in the path of a Gerund and has a Basic Feeling in the beginning of the path, Basic Feeling>Feeling-Logic Object>Logic Word>Gerund.

91/A Gerund is a Feeling based word even though the Gerund keeps the Noun name.
E.g. Runner

Noun - there goes the runner,
Logic Word>Gerund - The car is a good runner.

Nouns being Object Based and Gerunds Being Feeling Based. All Logic Words including Gerunds, Compliant Words originally had a Basic Object in the Path and have become and Deuced as Feeling Words.

92/Nouns can be used as Gerunds, Basic Object>>Basic Feeling>Feeling-Logic Object>Logic Word>Gerund. The Basic Object is dropped from the path and has been superseded by the Basic Feeling in the path so a Gerund has a Basic Feeling in the beginning of the path, Basic Feeling>Feeling-Logic Object>Logic Word>Gerund.

93/Verbs and Logic Words had a Basic Object in front of the Path, the Basic Object is dropped off the Path for Verbs and Logic Words. This is because the Basic Object is Deduced into a Feeling. The Basic Object is in the Path of Logic Words and Verbs is no longer needed and the Paths starts with a Basic Feeling.

Feelings are the Base for Basic Feelings. Objects are the Base for Basic Objects. All Words can be classified as either Feeling Words or Object Words.

94/Indicator Words have never had a Basic Object in the Path.

95/Nouns can be used as Gerunds, Basic Object>>Basic Feeling>Feeling-Logic Object>Logic Word>Gerund. The Basic Object is dropped from the path and has been superseded by the Basic Feeling in the path so a Gerund has a Basic Feeling in the beginning of the path, Basic Feeling>Feeling-Logic Object>Logic Word>Gerund. A Gerund is a Feeling Word even though the word was derived indirectly from a Basic Object. Verbs and Logic Words have a indirect Basic Object in the Path but are Feeling Words.

96/A Gerund is a Feeling based word even though the Gerund keeps the Noun name.

Runner

Noun - there goes the runner.

Gerund - The car is a good runner.

Nouns having a Basic Object in the Path and Gerunds having a Basic Feeling at the beginning of the Path. The Basic Object has been deduced into a Basic Feeling with Gerunds and the Basic Object has been dropped off the Path. Nouns are a Object Word and Gerund are a Feeling Word. Objects can be Deduced into Feeling.COMPLIME

97/Object Words can be described Noun or Logic Word linguistically. Depending on what we are talking about, Pertaining words be called Logic Word>Gerund or Noun. The path being Basic Feeling>Feeling-Logic Word>Logic Word>Gerund or Basic Object>Object Object>Noun.

98/Technically all Nouns can be used as Gerunds. A Gerund is a Feeling Word and called Logic Word>Gerund with the Gerund having a Noun name. Compliant Words have a similar names to the Gerund or Noun Name but Compliant Words do not use the parent Noun name. E.g. Noun - runner, Compliant Word - run, running, ran, runs. Compliant Word and Gerunds are a Basic Feeling Word with the Basic Object dropped from the Path and are Feeling Word.

99/Basic Objects>Object Objects>Nouns are from Memories of the External World through the Senses. The sequence for Logic Words is Basic Object>>Basic Feelings>Feeling-Logic Objects>Logic Words, and are derived from External Experience. This includes Basic Object>> Basic Feeling>Feeling-Logic Object Words>Logic Words>Gerunds, and Complimentary Words>and Verbs. The Basis Object is dropped off the Path and Deduced into a Basic Feeling.

100/Logic Word>Gerunds and Verbs are only linked to Nouns by name.

Truck.

Noun - This Truck is very good.

Logic Word>Gerund - Truck to the city.

Verb - Truck like car.

Nouns being a Object Word and Gerunds
and Verbs being a Feeling Words.

1/Verb are projected Logic Words so they have had a Basic Object in the path like verbs. The Basic Object is dropped so the path starts with a Basic Feeling instead of a Basic Object. The Basic Object has been transmuted into a Basic Feeling and the Basic Object is no longer relevant except in the knowing that originally the that Verbs and Logic Words had a Basic Object in the Path or are based on External Reality or the Senses. Verbs And Logic Words are based on the Senses even though they are Feeling Words with a Basic Feeling as the base in the Path.

2/Verbs are Inner Words based on Outer Words or Nouns. Verbs or descriptions show the Self's connection to the outside world. Verbs are the most personal words. Outer Words or Language Objects are the same thing in a sense. In general when using Describing Words called Verbs the usage is a projection of the Experience of Language Objects sometimes called Outer Words. We use Outer Words or Language Objects in Grammar for understanding. Outer Words and Language Objects are Nouns and Logic Words.

Verbs, Nouns and Logic Words form the Noun, Verb and Logic Word Triad. The Inner

Words Verbs are the link between reality and the Self. Outer words Nouns and Logic Words are not Inner Words. Inner Words are Verbs and Indicator Words. Verbs are the link between the Self as they are a part of the Noun, Verb and Logic Word Triad and Inner Words. We describe what we see.

3/Dynamic Filter>Indicator Words is a Basic Feelings>Feeling-Logic Objects but are not

based on Basic Objects and have never had a Basic Object in the path. This is the main difference between Inner Words Verbs and Indicator Words .

4/Both Indicator Words and Verbs, Inner Words are Feeling Words Basic Feeling>Feeling-Logic Words but Verbs originally based on Basic Objects that has been dropped from the path and are related to external reality or the senses. Inner Words>Indicator Words are Inner Words originating from the Self that has no relationship with reality or the senses like Inner Words>Verbs. Indicator has not had the Basic Object dropped from the path. Verbs have a indirect relationship with the Senses.

5/Verbs are still Inner Words like Indicator Word. Verbs reflect the experience of Logic Words. The path could be said to be of

Verbs Basic Object>>Basic Feeling> Feeling-Logic Word>Logic Word> Verb but as the Basic Object has been dropped the path is Basic Feeling>Feeling-Logic Word>Verb or Feeling Word.

6/When understanding Verbs one has to understand they are similar to Logic Words but Verbs have originated from the Self's machinations rather than the Senses. The Basic Object has been dropped for Verbs and Feeling projected onto reality.

7/Logic Words flowing in and Verbs flowing out. Verbs and Logic Words are like opposites sides of the same coin.

Verb - She is a beautiful cat.

Logic Word/Compliant Word - We need the beautiful.

Beautiful can be a Logic Word>Compliant Word or based on the Noun - beauty.

Beautiful can be a Verb Word or based on the Noun - beauty.

Beauty being a Noun. The Noun Beauty can also be used as Logic Word/Gerund and a Verb.

8/Indicator words have no relationship to Logic Words or Verbs in the sense that Indicator Words are not related to the Senses, Nouns, with no indirect Basic Object dropped from the Path. Indicator Words have a relationship with Verbs as they are both Inner Words.

9/Inner words/Verbs have a relationship with Inner Words/Indicator Words as they are both Inner Words. Verbs have also a relationship and Outer Words Nouns as Verbs are a part of the Noun Logic Word and Verb Triad. Verbs are the only Dynamic Filter in both fields of Inner Words and Noun, Logic Word and Verb Triad. Indicator Words do not do not have a relationship with Basic Objects/Nouns.

10/Beauty can be used as a Logic Word>Gerund. Gerunds has had a base of Basic Object dropped off the Path.

11/Logic Words>Gerunds being a part of the Noun, Logic Word and Verb Triad. The relationship within the Noun, Logic Word and Verb Triad being described by the Plastic Language Concept.

12/The Plastic Language concept is the phenomena where one word in the Triad can have interchangeable Dynamic Filters. Indicator Words are not in the Triad.

Nouns, Logic Words and Verbs.

Noun - The lady can be said to be a beauty, beauty being an object.

Logic Word - beauty is derived from the lady. Beauty being Logic. Flip the Logic Word to a Verb and we have -

Verb - beauty sadness is here, beauty describing sadness.

13/Verbs have to precede a Language Object, Nouns or Logic Words.

14/Gerunds can be called Logic Words in general and specifically Logic Words>Gerunds. The complete Path is Basic Feeling>Feeling-Logic Object>Logic Words. Originally the Path for Logic Words had a Basic Object at the front of the Path that is dropped as the Basic Object has been deduced into a Basic Feeling. Logic Words is the Dynamic Filter and Gerund being a Filter of Logic Words.

15/Indicator Words are not related to Nouns, Logic Words or Verbs or called The Noun, Logic Word and Verb Triad. Though Indicator Words are related to Verbs as Inner Words. Inner Words Verbs being indirectly based on Basic Object whereas Indicator Words only have Basic Feeling as a base. The Dynamic Filters can be described as Nouns, Logic Words and Verbs Triad contrasted by Indicator Words. The four Dynamic Filters are Nouns, Logic Words, Verbs and Indicator Words.

16/Nouns flow inward to the Self. Logic Words, Verbs and Indicator Words are all Basic Feeling>Feeling-Logic Words. Logic Words flow inward and Verbs and Indicator flow outward.

17/Inner Words Verbs And Indicator Words Flow out ward or out from the Self while

both being Basic Feeling>Feeling-Logic Words or Feeling Words. The Basic Object in the Path of Verbs has been dropped.

18/The Noun, Logic Word and Verb Triad, and the Inner Words Verbs and Indicator Words and Verbs have Verbs in common . Verbs or Descriptive Words and are the link to the Self. We describe what we experience.

19/Verbs being Describing Words.

Describing the Basic Feeling deduced from a Basic Object. Logic Words are also deduced from a Basic Object to a Basic Feeling. The Basic Object from both Paths are dropped off Logic Words and Verbs making the Dynamic Filters Logic Words and Verbs derived from Basic Feelings. Logic Words and Verbs use the same Basic Feeling.

Descriptions of Plastic Language verses Language Structure.

20/Language Objects are Basic

Object>Object Objects>Nouns and Basic

Object>>Basic Feeling>Feeling Logic

Objects>Logic Words. Words are versatile.

Nouns can become Logic Words>Gerunds.

Verbs are the Projected Logic-Feeling of

Logic Words. The relationship of Nouns,

Verbs and Logic Words and are a part of the

Plastic Language Concept worked out from

the Syntax of Language Structure.

21/Gerunds are Feeling-Logic Objects based

on Nouns in Language when Noun is used as

a Logic Word show words are versatile,

demonstrating the Plasticity of Language.

22/Basic Feelings transmute to Feeling-Logic Objects. Basic Feeling>Feeling-Logic Objects are the Base of Feeling Words.

23/When a Feeling is remembered as a Basic Feeling the Basic Feeling is interpreted as a Feeling-Logic Object. Logic Words and Verbs the Basic Object is dropped, the Basic Object remains unchanged, we just have a new Basic Feeling. When the Feeling is remembered the Feeling becomes a Basic Feeling and the Basic Feeling becomes the Base for Feeling-Logic Object and Feeling Logic Objects is the Base for Feeling Words.

24/“Runner” can be a Basic Object>Object
Object>Noun or Basic Object>>Basic
Feeling>Feeling-Logic Word>Logic word.

25/In the Triad a Noun becomes can become
a Logic Word the Logic Word the Word is
called a Gerund. Gerunds are a Filter in the
Dynamic Filter family Logic Words. This is
the phenomena of Plastic Language.

Language Objects and Inner Words.

26/In Grammar Layer Nouns and Logic
Words are called Language Objects. Verbs
and Indicator Words are Inner Words.

27/Language Objects can be used as Target Objects for Verbs and Indicator Words called Inner Words. Indicator Words direct or designate Language Objects. It is hard to see a Inner Word Indicator Word>Finite Word like “the” being a Target Object. The Indicator Object Word like Protocol “they” can not be used as a Target Object. Protocol Word “they” indicates a Language Objects.

28/Inner Words Indicator Words>Protocol Words are indicating a Language Objects and are not a stand alone word. Inner Words Indicator Words>Finite Words indicate Space-Time relationships for Language Objects and Verbs are describe Language Objects.

29/Inner Word Indicator Word>Protocol
Word “They” - What are “they”? The
Indicator Word “they” the indicates a
Language Object, a Noun or Logic Word. The
word “They” indicates a Target Object. Here
“They” is referring to a Language Object,
either a Noun or Logic Word. “They” is not a
stand alone word and therefore a Protocol
Word.

30/A Verb is a projection of Logic Word - Basic Object>>Basic Feeling>Feeling Logic Objects>Logic Word to Basic Object>>Basic Feeling>Feeling Logic Objects>Logic Word>Verb. The Basic Object does not really matter except in understanding the origin of the Word. Basic Feelings does not change, though the Basic Object may be forgotten. Logic Words and Verb are a Feeling Words.

Indicator Word>Finite Words and Indicator>Protocol Words have Basic Feeling>Feeling-Logic Word Base. Indicator words have no direct or indirect Base of a Basic Object. An Indicator Word is a Feeling Word.

31/The two Dynamic Filters Verbs and Indicator Words>Finite Words and Protocol Words are Inner Words. One can easily say Verbs, Finite Words and Protocol Words are Inner Words. Finite Words and Protocol Words and have no Basic Object as a base though Verbs are indirectly have a Basic Object base. Verbs and Indicator Words are Inner Words.

32/Finite Words are like Dos Commands with Time-Space placements in Language from the Self Indicating Space Time dimension to a Logic Words or Nouns. Nouns and Logic Words are called Language Objects. Nouns and Logic Words are Language Objects and are based on the Senses and Nervus System. The path for a Finite Word is Basic Feeling>Feeling-Logic Object>Logic Word>Indicator Word>Finite Word>Word.

33/Protocol Words indicate Language Objects and Finite Words indicate and direct Space-Time relationships for Language Objects. Protocol Words, Finite Words flow outward from the Self or and Verbs also flow outward from the Self or I Object. Verbs or Descriptions Words reflect the Logic learnt from Logic Words. Nouns and Logic Words flow inward to the Self or I Object and are based on the Senses and Nervus System.

34/Language Objects flow inwards and are from External Reality based on the Senses and Nervus System. The paths are Basic Object> Object Object>Noun or Basic Object>Basic Feeling>Feeling-Logic Word>Logic Word. Nouns and Logic Words are called Language Objects.

35/The difference between Protocol Words and Finite Words from the Dynamic Filter Indicator Words is that Protocol Words

Indicate Language Objects and Finite Words give Dimension to Language Objects.

Protocol Words and Finite Words are from the Dynamic Filter Indicator Words and directed from the Self and are called Inner Words. A Verb is also an Inner Word.

36/Indicator Words Indicate External Objects called Language Objects based on the Senses including Emotions and Pain. Even though Indicator Words Indicate External Language Objects Indicator Words are Internal Words from on the Self.

37/Verbs are based on Experience of Basic Objects>>Basic Feeling>Feeling-Logic Words. Flipped Logic Words are transmuted into Verbs and Verbs are Internal Words projected from the Self.

38/Language Objects Nouns and Logic Words and are based on Basic Objects including Pain and Emotions. Logic Words have a

indirect Basic Object. Protocol Words stand in for Language Objects.

39/Indicator Words and Verbs are similar as they are Inner Words. The original Basic Feeling was Deduced from a Basic Object. The Basic Object has been Deduced into a Basic Feeling and stands alone as a Basic Feeling. The Basic Object has been Deduced into a Basic Feeling. A Basic Feeling when used for a Verb is projected and is used to project a description and no longer has a relationship with External Reality but is a Inner Word based on Feeling. Inner Word Indicator Words do not have a relationship with a Basic Object through through the Senses. Indicator Words and Verbs are Inner Words based on the Self.

40/Verbs describe Language Objects.

Indicator Words>Protocol Words stand in for Language Objects. Indicator>Finite Words give Language Objects space-time dimension. Verbs and Indicator Words are Inner Words based on the Self whereas Nouns and Logic Words are based on the Senses.

41/Logic Words, Verbs, Nouns and Indicator Words and are called the Dynamic Filters.

The Word Layer can be interpreted with the Dynamic Filters. The Objects is another name for Basic Feelings and Basic Objects.

The Memory Objects is a name for Object Objects and Feeling-Logic Objects. The Objects and the Memory Objects are

designated Words in The Word Layer.
Words designate The Objects with their
counterpart Memory Objects.

42/So the word “it” is a sound symbol that
represents the Basic Feeling Deduced from
the Feeling of “it”. The word "car"
represents a Basic Object of a car
remembered from a Perceived car. These
Objects are Rationalized or Deduced into
Memory Objects.

“It” and “car” are Words Symbols form the Word Layer. The Objects, Memory Objects and Word Layer are called the “Word Layer”. In the Language Manual we have the Word Layer and the Language-Grammar Layer. The Word Layer Designation is representing the Designations of The Objects, Memory Objects and the Word Layer. The Language-Grammar Layer representing Syntax Relationships of Words from the Word Layer. The Word Layer is a general Name for the Three Components, The Objects, The Memory Objects and The Word Layer. The Name Word Layer is used Twice. The three Designations are called The Word Layer. Words are from the Word Layer.

43/“It” is in the Dynamic Filter Indicator Word coral. So when talking about the word “it” we can say the word “it” is a Indicator Word>Protocol Word. We can simply say “it” is a Protocol Word, “It” is in the Protocol Word Filter.

44/Indicator Word>Protocol Words “it” indicate Language Objects. Language Objects are Nouns or Logic Words. Nouns and Logic Words are based on External Experience. Indicator Words/Finite Words are a Space-Time Direction from the Self, the Pan Dimensional Reality of the Self. Finite Words Indicate Space-Time relationships to Language Objects. Though Verbs are indirectly based on Nouns they are Inner Words. Verbs Describe Language Objects.

45/Verbs are Inner Words to the Self and do not exist in this sense like Language Objects. Indicator Words>Finite Words can not suggest Space-Time relationships to Verbs. “This wonderful.” Finite Word>Verb. “This” being a Finite Word and “Wonderful” being a Verb. Also one can not have “A wonderful.” Finite Word>Verb, make no Sense.

47/We can have Finite Words with Nouns and Logic Words. Finite Word>Nouns “This car.” “This” being a Finite Word and “car” being a Noun. We can have “A Presumption”, “A” being a Finite Word and “presumption” a Logic Word>Compliant Word or simply a Compliant Word.

48/In Plastic Language Noun, Logic words and Verbs are interchangeable Dynamic Filter to a Word. Wonderful can be a Noun, Logic Word or Verb. Wonderful has to be simplified into a Noun from a Compliant Word. Wonderful comes from the Parent Noun Wonderer.

Noun - Wonderer, a person who a person who Wonders.

Logic Word>Compliant word - wonderful

Verb - wonderful,

For Wonderful to be a Verb Wonderful has to precede a Language Object. We can have Wonderful Cat, Verb>Noun . If we swap around Cat with Wonderful we get Cat Wonderful, Noun>Compliant Word. Here Cat becomes a Verb. The string become Verb>Compliant Word. The string becomes

a Logic String. With Wonderful Cat the String becomes an Object String.

Wonderer can be a Noun or Logic Word>Gerund as Nouns and Logic Words>Gerunds are interchangeable as per Plastic Language Concept.

Noun - Wonderer, a person who a person who Wonders. Wonderer as Noun - Wonderer is a man or the man is a Wonderer.

Logic Word>Gerund - The man has a Wonderer for a guide. Wonderer being a Gerund. A Gerund being Feeling-Logic.

Here “Wonder” is a Pun, Wonderer either being a Noun or Logic Word. As per Plastic Language. Wonderer being Noun from a Basic Object or Gerund from a Basic Feeling. A Gerund uses the same Name as a Noun, here, Wonderer. Wonderer being a Noun or

Wonderer being a Logic Word>Gerund or simply called a Gerund.

49/Verbs are Logic Words projected and Logic Words are Based on Nouns. So we can “presume” a Logic Word>Compliant Word projected as a Verb. The Logic Word>Compliant Word Presume originally from the Noun Presumer.

47/“Presume time” Presume here is a Verb and Time a Logic Word. The String is Verb>Logic Word/Compliant Word. So Presume is a Verb describing Time, Time a Logic Word. We can also have “Time Presume” another String. Here Time has become a Verb and Presume a Logic Word>Compliant Word or simply described the String as Verb>Logic Word. Presume can

be a Logic Word or Verb. Time can be a Logic Word or Verb. Presume is not a Gerund so we do not have to worry about Presume being a Noun.

48/I believe all Logic Words/Gerunds can be turned into Verbs if you try. Time and Presume transformed from a Verb to a Logic Word and a Logic Word to Verb. “Time” is a Gerund from the Dynamic Filter Logic Word Filter, in the Noun, Logic Word and Verb Triad.

Noun Basic Object> Object Object>Co
Noun>Time.

Verb Basic Object >>Basic Feeling> Feeling-
Logic Object>Verb>Time.

Logic Word/Gerund Basic Object >>Basic
Feeling> Feeling-Logic Object>Logic
Word>Gerund>Time.

49/Logic Words>Compliant Words have a
Gerund as a Base. A Gerund is Logic Word
with Noun Base with the Base Deduced into
a Logic Word>Gerund. The Noun Name
associated with the Basic Object in is used
for the Gerund. For example the Noun Word
Car is used for the Gerund Word Car. The
Word Car as a Gerund represents the Logic
Object Car. The Word Car can be used as
Noun or as Gerund. Compliant Words are
Feel Words or Logic Objects associated with

the Gerund Car. Cars is a Compliant Word when used as a Gerund Car.

50/Presume is a Compliant Word to the Parent Gerund Presumer. Presumer can a Noun or Gerund, Presumer can be a Noun, or Logic Word>Gerund. The Path for a Compliant Word/Presume is Basic Feeling>Feeling Logic Object>Logic Word>Compliant Word, or simply the Path can be said to be Logic Word>Compliant Word. Presume can simply be called a Compliant Word.

51 To find the difference between a Indicator Word with the Noun, Logic Word and Verb Triad. A Indicator Word can be worked out by seeing if a Word does not fit into the Triad by working out if the Word in question seeing can be made into a Noun. Nouns and Gerunds are obviously related to Nouns as they use the same name. With Logic Word > Compliant Words one has to search for the Noun Relationship. Example - The word Dig is related to Digger a Noun. So Dig is not an Compliant Word or Logic

Word>Compliant Word. Salacious has the Parent word Salator. Salator being a Noun and therefore Salacious being a Compliant Word and not an Indicator Word.

52/I believe Words can be Nouned to find their Origin. Salator is not in the Dictionary but for me is a Valid Word. The Language Manual may seem to add many Words to the Dictionary but for words to be Nouned simplifies Language. Salator is a Noun directly Base on the Senses. Salator can be a Logic Word>Gerund. Salators is a Logic Word>Compliant Word.

53/Important to know which words are Logic Word>Compliant Words so we can work out what Indicator Words are. Compliant Words look similar To Indicator Words. We test Compliant Words and Indicator Words to see if they have a Noun Base. If there is no Noun Base for a word these words are in the Dynamic Filter Indicator Words. If the word has a Indirect Noun Base the Word is a Logic Word>Compliant Word. Logic Word>Gerunds have a Indirect Noun Base but this is obvious as the Gerund uses the same Noun Name.

54/When Language Objects are butted together the last word in the sequence becomes the Target Object and the First Word Becomes a Verb. The Target Object word can either be a Noun or Logic Word, called Language Objects. The Target Object Word with the Verb can be used to create either a Object String or Logic String.

55/If one has Two Word Object String or Logic String with Language Objects butted together the first Language Object of the String become a Verb and the second word becomes a Target Object. The Target Object is a Language Object, a Noun or Logic Word .

56/A two word string is a combination of Logic Words and Nouns with the first Word becoming a Verb and the second becoming a Noun or Logic Word. This is possible because of the Plastic Language Phenomena of Nouns, Logic Words and Verbs having interchangeable Dynamic Filters.

57/Three Word Strings Logic Word>Logic Word> Noun becomes Verb>Verb>Logic Word or Noun>Noun>Noun becomes Verb>Verb>Noun. A these are three word Word Strings, a form of a Word Strings. The length of a Word String is from two words to infinite words up to the Target Object. All the words up to the Target Object become Verbs.

58/Blue Intelligent Helicopter Man, Noun>
 Logic Word>Noun>Noun become Verb>Verb
 >Verb >Noun. The Co Noun Blue being in
 the Noun Dynamic Filter. Co Nouns are
 Nouns that are in relationship with another
 Noun. Waves are also Co Nouns to Water.

59/Language Objects are External Words
 Based the Senses. Verbs are a Internal
 Words based on the Senses. Language
 Objects are Nouns and Logic Words.
 Indicator Words are Inner Words. Indicator
 Words indicate Language Objects and Verbs
 describe Language Objects.

60/Language Objects exist in their own right. Logic Words>Compliant Words are described as Language Objects. One “can Presume” and one “can Beautiful”. Paths, Finite Word>Logic Word. A Verb or Describing word has to precede a Language Object so in these examples Presume and Beautiful are Target Objects so they are not Verbs.

61/A Basic Feeling is remembered as a Feeling Logic-Object and Basic Objects are remembered as Object Objects. Feeling-Logic Objects and Object Objects are Memory Objects. All Memory Objects are represented by a Sound Symbols Words.

62/The Basic Feeling of “it” is represented usually by the sound symbol of the word “it”. One could represent the Basic Feeling of “it” by pointing. The word “it” is a Indicator Word>Protocol Word or Simply an Indicator Word, or simply a Protocol Word.

63/Object Objects and Feeling-Logic Object are Memory Objects. Memory Objects are designated by Words. A Word represents a Memory Object. Memory Object represents a Basic Feeling or a Basic Object called The Objects. Words represent Basic Objects>Object Objects and Basic Feeling>Feeling Logic Objects.

64/When we think in Memory Objects, the memory’s of Basic Feelings and Basic Objects. We articulate what we think into Words and Language Grammar.

65/The Basic Object>Object Object of a “truck” is denoted by the word “truck”. The word “truck” is a Sound Symbol. The word sound symbol “truck” is a Sound Symbol and depending on which Dynamic Filter is being used to define the word truck, truck can be a Noun, Logic Word and Verb. The word “truck” is derived from a Basic Object and the Basic Object can be used to Deduced into Basic Feeling Words Logic Words and Verbs.

66/With “Truck like car” sentence the sequence should be Verb>Verb>Noun. Like being a Logic Word/Compliant Word to the Noun Liker. Car could be a Logic Word making a Logic Word String but usually this would be seen as a Noun String with Car being a Noun, one has to use common sense. But all is not what appears, the Word “Like” changing the String into a Metaphor so the String becomes Verb>Logic Word>Noun, a Statement and Metaphor, I believe. I think only the Word “Like” can be used to make a Metaphor.

67/“Truck like car” is Verb>Logic Word>Noun. “Truck” being a Verb Describing Car. As per Plastic Language Concept.

68/Word Sound Symbol s are symbols
 Objects Words or Feeling Words. Feeling is
 Logic. Memories Objects, Object Objects
 and Feeling-Logic Objects are Logic Objects
 enabling Plastic Language for Words. We
 think in Memory Objects. When describing
 words we do not worry about the term Logic
 Objects. We use the Term Logic Objects to
 understand the Plastic Language Concept
 especially how Nouns can be seen as
 Gerunds and Verbs. Object Objects with a
 Basic Object base are conceptualized as
 Logic Objects so we can think. When
 describing Words we do not worry that
 Object Objects are Logic Objects. Feeling
 Logic Objects are Logic Objects any way.

69/Basic Objects are remembered separately to Feeling Objects. Both Basic Objects and Basic Feelings are the base for Memory Objects. Memory Objects are the base for Words. The Plastic Consciousness of Language is possible because all Memory Objects including Object Objects are Feeling Objects. Logic objects can be considered as Logic Objects. When talking about Words or Language Grammar we do not worry about the classification of Logic Objects.

70/With tradition Compound Nouns one can have statement “armpit”. Or arm pit.

Armpit sounds like Noun Noun. I think Armpit is two sound symbols describing a single Object Object or or a Noun in the Dynamic Filter Corals. When one puts Noun against a Noun, a Word Butt the first Noun would convert to a Verb. I believe the path of the first Noun in this case would be a Verb>Noun as this is a Word Butt.

Verb>Noun. With armpit the words are joined so there they are not is no Verb Noun>Noun. The Traditional Compound Word is considered to Noun>Noun.

If we have “Presume Like Sadness”, we have Logic Word>Logic Word>Logic Word. A Metaphor as Like here is a Logic Word. a special Word indicating the are very similar

or the same, “Presume Like Sadness” is a Logic String.

“Truck Like Car” an Object String can be Noun>Logic Word>Noun. A Metaphor and not a Word Butt. Metaphors are some of the most beautiful things language.

“I presume the tree fell on the house”.
 Noun>Logic Word>Protocol
 Word>Noun>Logic Word>Protocol
 Word>Protocol Word>Noun, a Object Sentence. A normal sentence. The Object Strings are “I presume the tree” and “fell on the house” creating a Object Sentence. This is an Object Sentence as the sentence is

about the House, a Noun or Basic
 Object>Object Object>House. House being a
 Noun or Object>Object Object>Noun.

Dynamic Filter Indicator Word Includes The
 Filters Finite Words and Protocol Words.
 Filters Finite Words and Protocol Words are
 simply referred to as Indicator Words. An
 Indicator Word only indicates Language
 Objects. Indicator Words are Inner Words
 and have no relationship to Language
 Objects Logic Words and Nouns.

Logic Words have direct relationship with Nouns. Logic Words are Gerunds, Complimentary Words and Predominate Words. Gerunds, Complimentary Words and Predominate Words are simply referred to as Logic Words. Logic Words have direct connection with Nouns when the Nouns become Gerunds.

The word “it and you” are in the Dynamic Filter Indicator Words and in the Protocol Word Filter. The word “it” and “you” are Protocol Words>Indicator Words or simple called Indicator Words.

Adjectives are in the Dynamic Filter Nouns in the Filter Adjectives. Experience and relates to reality or Basic Objects>Object Objects>Nouns and in the case of Adjectives Basic Objects>Object Objects>Nouns>Adjectives. “Love” is an Emotions which are in Dynamic Filter Nouns and the Filter Adjectives and Adjectives can be simple be called Nouns. So love can be called a Noun.

Protocol Logic Words do not relate to Nouns. The word “to” is a Protocol Logic Word in the Dynamic Filter Indicator Words. The Dynamic Filters are Nouns, Verbs, Logic Words, and Indicator words.

With the Dynamic Filter simplifications we can work out the Grammar of sentences.

We have being describing Metaphors for example witch could be said to be Grammar. We have Phrases and when Phrases are joined by Protocol Logic Words we have a String. A Sentence may be made up from a String or few Strings or more. Sentence can be a Statement or a Question. Statements and Questions imply an Argument. Must admitt I am not very good at Psychology. So I am not sure what this means but I believe once we have paragraph the Paragraph can be deduced as Logic Paragraph like Logic Words or a Verb Paragraph like Verbs or a Noun Paragraph like Nouns. We may also have a Indicator Word Paragraph. The chaptors of a book may also be Noun, Verb, LogicWord Chaptors. The book may also be Noun, Verb and Logic Book. When Ships are being talked about the Book is a **Object Book** or Noun Book. Philosophy or Psychology are probable Logic Books and A how to use a

Computer is probably a Verb Book. If we have a Verb book. A Verb book is based on Experience or Logic. Logic is Feeling. So a book can be a Feeling-Logic Object. A Feeling-Logic Object Book.

If we have two Noun Books and liken them with the word “Like” we have a Metaphore. Without Metaphores nothing would make sense. Metaphore is when two things are like each other or the same, a Metaphore also fits a description of Love, even when expressed as Hatred.

Verbs can either describe an Noun or a Logic word.

Eg: the word “new” as a Verb can describe a Noun or a Logic Word. A new car, or, a new dogma.

A sentence can consist of series of Verbs and can include a Noun as Verbs. describing Objects or Logic words.

Example: A beautiful work truck dogma.

Eg: A massive great lovely beautiful truck car.

Therefore multiple Nouns as Verbs should be able to make a sentence describing a Noun

or Logic Word. Pushing Reflection Theory to a limit.

Nouns as Verbs in a sentence describing a Noun-

Eg: city wall house book piano

Nouns as Verbs in a sentence describing logic:

Eg: city wall house book dogma.

Nouns and Logic Words intermingle Eg:

When a Noun is at the front of a Word Logic Word the Noun word becomes a Verb. Eg: “cat soft”. The Noun becomes a Gerund Verb describing Logic Word “soft”. The Noun can come second “soft cat”, the Verb works describing an Object cat. Verbs can bank up eg: lovely beautiful soft cat. A process of Nouns and Verbs bank together to create discription as Verbs culminating as a Noun or Logic words.

A Verb can not descibe a Verb. The Verb needs a Noun or Logic Word to describe. Internal Objects Words Indicator Words can be described by Verbs but the Indicator Word really indicating a Language Object Noun or Logic Word.

Internal Objects Indicator Words and Verbs do not really exist as an Object so one can not describe Internal Object. Except that it is a description How do you describe the word “they” or “it” a Indicator Object Words or “the” or “a” Protocol Logic Words. A sentence needs an Object, a Noun or a Logic Word which are Language Objects to exist in Language.

A sentence needs needs a Language Object to exist. Nouns which denote Object Objects are Objects that can be used as a Target Word in a sentence. When a Noun is

used as Logic Word the Noun no longer denoting an Object Object but a Feeling Logic Object Gerund. Never the less can be described by a Verb.

A Gerund can be a Verb or External Logic word. When the Gerund is used as Target Object the word is still an External Logic Word. When the Gerund is being used as a Verb, an External Object Word the Gerund is no longer a Language Object and there fore can not be a Target Logic word.

Indicator Words Indicator Language Object
 Words denote either Nouns or Logic Words.
 Protocol Object an Internal Objects words
 Indicate Protocol to a External Object . One
 can have a sentence with the Internal Object
 Word “it” as a Target Object but what is “it”?
 “It” denotes External Object. “It” is a
 Indicator Object Word and an Internal Object
 word. “It” is indicating an Internal Object.

Feelings and Objects or Object Objects are
 Feeling-Logic Objects can be called “The
 Objects” and are the Primary Language
 Objects.

If two Logic Words are put together the first logic word becomes a Verb. The Verb enhances the Logic Word. To put a Protocol Object word between two Logic Words the Logic Word modifies the second Logic Word Logic according to the Protocol Logic. When two Logic Words are put together the first Logic Object Word projects as a Verb describing the Logic word or Target Object Word. A Target Object Word is a Language Object. Maybe we can call Verbs and Logic word sequences a Modified Logic or a Logic Line. A Sentences consist of Logic Lines broken up by Protocol Logic Words.

Nouns can be used as Verbs. Add in some Protocol Logic Words to the word sequence and sugar and we can have “The Appearance” and “A sugar”. Add in another Verb the word

beautiful and to the logic line and the Logic Line becomes “The beautiful appearance” and “A beautiful sugar”.

Logic Lines can have many Verbs and the meaning may become obscure but they logic line is still a valid.

Eg: “The beautiful lovely tender happy tired hard friendly sugar” The words leading up to the logic word change to Verbs unless broken up with Protocol Logic words. We can join the two logic lines with a Protocol Logic words.

Eg: The beautiful lovely tender happy tired hard friendly sugar was with the beautiful lovely tender happy tired friendly appearance cheddar cheese.

Logic Words are opposite to Protocol Logic words. Logic Words have External Logic

where as Protocol Logic Words have Internal Logic. A sentence has to be about an Object. Making a sentence about a Verb is very difficult because when the Verb is on its own the Verb becomes a Logic Word, a experience. Object represents a Language Object.

I surmise a sentence is either about a Logic Word, an External Object or a Noun, a External Object. A paragraph is either about a Logic Word or a Noun. I find describing in Indicator Object Word difficult. The Indicator Object Words are Internal Logic and indicates **Nouns or Logic Words**.

A sentence can not be about a Verb as Verbs are dicription of something. If the sentence seems to be about a

Verb really the Verb has changed into a Logic Word.

Now, lets back track.

Dynamic Filters.

I use the term “Dynamic Filters” and the “Filters” to describe the Filters I use. Verbs Dynamic Filter has no Filter. The Filters I am describing are an upgrade of the old language filters Noun, Verb and Adjective. All Filters float above words and interpretate words.

The Dynamic Filters are Noun, Verb, Indicator Words and Logic Words. The Dynamic filters brake down into Filters as designated. There may even be some Subfilters.

Words denoting Memory Objects create Language Base and are interpreted by the Filters.

The Dynamic Filters are the main discriptive Filter names. The Dymanic Filters break

down into the Filters for the designation of a word individually. Verbs Dynamic Filter has no Filters. Verb is a stand alone Dynamic Filter.

The Logic Word Dynamic Filter, the “Verb” Dynamic Filter and the “Indicator Word” Dynamic Filter are Feeling-Logic Object based words where as Noun Dynamic Filter is for Physical Object based words. Nouns are representations of Physical Objects. Logic Words, Verb and Indicator Words are Feeling Based Words. External Object Words

can be a Target Word in a Logic line. Logic Lines make up sentences. A series of Logic Lines form a string. When a Noun can become a Logic Word the Noun is called a Gerund. When the logic of a Logic Word is projected the Logic Word becomes a Verb (or description). So Nouns also can be Verbs as a descriptive words. Nouns as Verbs and Logic words are called Gerunds. Maybe all Nouns can be used as Logic Words and therefore as Verbs. The projected Logic of the Noun is used as a description.

Examples:

Sinner (a noun) should be able to be used as a Verb (a descriptive word) and in doing so becomes a Gerund. The word "sinner" can be used as a Gerund and as the word sinner is being used as a Gerund can be used as a Logic Word External Logic.

I danced with “sinner” magic. Sinner here is a describing word describing magic, Here sinner is describing word, a Verb.

To be a “sinner” is to be free. - Sinner as Experience, External Logic Word and a Logic Word.

The “sinner” was taken to jail. -

Sinner as Noun, a Physical Object.

“The reception staff”. - Reception as a Verb
 “reception” describing the staff.

At “reception”. - Reception as a place or object Reception as a Physical Object as a Noun .

Gave a good “reception”. - Reception as Logic. Reception is an External Object and Logic word.

“Reception” can be seen as a Verb, Logic word and a Noun. “Reception” is a Compliant Logic Word (Gerund) as the word is compliant to the Physical Object and Noun Place as “Reception”.

The difference between Logic Words and Indicator Words and Verbs. Logic Words, Verbs and Indicator Words are all Feeling based words, Feelings are Logic. The difference is that Logic Words are Feeling and have a relationship with Adjectives where as Verbs and Indicator words are Logic. Logic Words are deduced as Internal Objects and mainly are Noun based except for the Predominate Logic Word which is a Internal Object Word but is deduced as an Internal Object with out a Noun base. The external logic words are deduced differently from Internal Object and can not be used as a Language Object. External Objects are logic that direct or describe. Logic Words can be used like a Physical Noun in language. The

External logic words Verbs and Indicator Words can not be used as Objects like Nouns or Logic words in language. The External Objects Indicator Words and Verbs describe and direct the Internal Objects words and Nouns.

Predominate Logic Words, are a External Object Word, and a Experience word. Predominate Logic words have properties like Nouns and Noun based words and their families words even though they are not related directly to a physical Object like Noun. Gerunds are Logic Words and Verbs based on Nouns. We can talk about the word “presumptuous” as an Object.

Logic Word and Nouns are Internal Object.
Internal Objects can be used in Logic Lines
and Sentences.

Words can have similar properties. Internal Objects Logic Words are Experience words which creates an Internal Object comparable to a Physical Noun Object in Language. The Internal Objects which are experiences are like physical objects Nouns in language are used Logic lines or Sentences as Objects.

So we can say In Representation Objects are Logic as Noun can be used as Gerunds proving Memory Objects are a Plastic Consciousness of Feeling once remembered. Internal Objects and Physical Objects are Language Objects. Language Objects are Memory Objects that are Feelings from of the Plastic Consciousness. So all Objects in Sentences and have equal value and can be the Target Object of a Logic Line of equal value.

eg. A truck like car is a Noun describing a Noun. How can a Noun describe a Noun unless Nouns can be used as Logic, Logic is feeling and is a Plastic Consciousness. So in language Nouns can be Feeling-Logic Words and are called Gerunds. The above “truck” here is the Gerund of the word truck being used as Verb. Gerunds are Nouns being used as Verbs and or Logic words.

So we can have the sentence “a presumptuous car” or “car presumptuous”. The first word being a Verb and the second word the Target Object. The Target Object word being a Internal Object Word Presumptuous”. The Internal Logic Word is a Logic Word. All Logic Words are Internal Objects. So the phrase “a presumptuous car indeed” has “car” as a Feeling-Logic Object a Feeling based word and a Gerund here being used as a Verb.

The example of “a car like truck” because the word “car” can be used as a Verb and the word “car” here has the path - Object> Memory Object > Feeling-Logic Object Word > Logic Word Gerund Verb.

As Object Objects and Feeling-Logic Objects have been remembered as Memory Objects the words representating these objects can be interpreted in language by the Dynamic Filters. Language is Memory Objects are represented by sound symbols words.

Nouns are perceptions of physcal objects and these perceptions are designated by words.

Feeling-Logic Objects and Object Objects are interpretations of objects and feelings that have been remembered as a Plastic Consciousness of Memory Objects.

Words designating Memory Objects are very powerful but really they are a representation and reality can only be understood by symbols of Feeling and Objects. Really Logic Words are our only Reality.

Words are sound symbols representing objects and feelings. I call Objects Object Objects and Feelings Feeling-Logic Objects once Feelings and Objects are remembered. Dynamic Filters interpretate Object Objects and Feeling-Logic Objects words (all words). The Dynamic Filters are Nouns, Verbs, Logic Words, and Indicator Words. The Dynamic Filters break down into Filters for descriptions of words.

“It and that” are in the Indicator Word coral as Protocol Object Words and can indicate Logic Words and Nouns.

An Eg: of a Indicator Word Protocol Object word “it” representing a Protocol Object word “it” - I think “it” is “it”. Still the word “it” is a Protocol Object Word designating an unknown Noun or Logic Word.

Eg: ‘There are “many” cows. Here “many” is describing the relationship between cows (Protocol Logic Word). For the word “many” to be a Logic Word “Many” has to be able to be used as a describing word Verb and a

Logic word. As the word “many” can not be experienced therefore word “many” is not a Logic Word and therefore not a Verb (describing word). So the word “many” has to be a Protocol Logic Word. The word “many” does not describe a Noun in particular. “Many” has to be a Protocol Logic Word.

When the logic of a Logic Word is projected the logic can be used to describe Objects (Nouns and Internal Objects Logic Words). Logic words are complimentary to Verbs. Logic Words Dynamic Filter has to be seen in conjunction with Verbs Dynamic Filter. Logic can be used to describe when projected. Logic Word becomes a description or a Verb when projected.

Example . The word “reception” as a Verb and a Logic Word. The reception (verb) staff gave a good reception (Logic word). A Verb has to be based on a Logic Word Which include Gerunds.

The word reception can also be used as a Noun. “I went to reception”.

When a Noun is used as a Logic Word or Verb the Noun is called a Gerund.

The Floating Filter System does not alter language. The floating filter simply interprets language.

The Protocol Logic words direct the Objects where as the Indicator Object words indicate Object words that are physical or internal objects. External Logic Objects relates to something other than its self and are called Verbs Indicator Words .

Logic words are experience words and Internal Object Logic where as Verbs and Indicator Logic Words are External Object words and are about logic outcomes other

them selves. We can experience the word “appearance” but not experience the word “the”. “Appearance” as a Logic Word and “the” as a Protocol Logic word.

Protocol Logic words have a logic where they direct the relationships of Object Objects and Internal Objects.

I do not use the old system because all words are object-subject based in Reflection Theory. Some Protocol Logic words are - into, the, a, some, maybe, on, not and as. Maybe there are Protocol Logic word phrases like “do not ”, “are the ”, “because all”. The Protocol Logic words meld the other Language Objects together.

We can not experience Protocol Logic Words External Logic as we can Experience Internal Logic or perceive Nouns. We seem to need Protocol Logic to make sense of our Nouns and Logic Words. Change the Protocol Logic word and change the meaning of the phrase or word to create a new Logic Line or Phrase.

Indicator object words can indicate Protocol Logic words when pushed but really this is not the function of Indicator Object words. eg: it was the, Indicator Object words are an easy way to signify Objects Nouns and Logic Words especially when we do not know the name of the object or are too lazy to think of the name of the an Object. Indicator Object Words are not suited to be indicated by Indicator Object Words. Indicator Object Words can not indicate an Protocol Logic Word.

Protocol Logic Words are use to indicate logic steps for Nouns and Logic Words. Protocol Logic Words which are External Logic and can indicate protocol for Nouns or Logic Words. We call Indicator Words Indicator Words because they Indicate and direct. Indicator Words glue everything together with indications of logic.

Dynamic Filter Sequence.

Language Objects can seperated by a Protocol Logic Words. Protocol Logic Words are Internal Logic and only exist in relationship to Nouns and Logic Words . Nouns and Logic words are Language Objects. Indicator Words are not Language Objects. Indicator words are Protocol Logic Words and Indicator Object words. Indicator Object Words are used to facilate Language Objects and represent mostly Language Objects. Do not think Indicator Object Words can

represent a Verb. I think a Protocol Logic word can not direct a Verb unless the Verb is in relationship with a Language Object. Really Indicator Object Words are Word Symbols representing Language Objects. Language Objects are Nouns and Logic Words. Protocol Logic are different to Indicator Object Words as Protocol Object Words are the Logic Steps used the Self where as Indicator Object Words only represent other words.

So Logic Words and Protocol Object Words are the important words in Language. They really are the facts. Noun have to be perceived. And are transposed by Logic

word and Protocol Logic Object Words. Nouns are quite are quite hard to understand. Describe a car for example. We really only know Nouns by their symbolic word name. By generalising Nouns as word symbols we have the the building blocks of Language. But we do not really know what Nouns are. We know what Protocol Object Words and Logic Word because they are based on Feelings. This is possible because the Memory Objects are a Plastic Consciousness. Nouns or Objects are also feelings once remebered, For example "Truck like Car".

Logic Word are Experience Words and External Logic Words based on Objects or Nouns where as Protocol Logic Words are Internal Logic Words related to the Self.

Word like; many; a; the; are Protocol Logic Words. They are the closest link to the Self. They are really the Self collateing knowledge for the Self.

Protocol Logic Object Words are Nouns Modifiable Logic where as Logic Words can become Modifiable Logic.

Logic words are Experiences which related to objects (Nouns) and also external to the Self. The experience of the Logic Words can change. One can not describe a Protocol Logic Object Word with a Verb: like a “happy many”. But a Logic Word can be modified by a Verb. Like a Happy Presumptuous. Here the word Presumptuous has been modified by Happy. A new Basic Feeling-Logic Object. Happy Presumptuous. Presumptuous has changed. One cannot change “Many”. A ProtocolZLogic Object Word in the Dynamic Filter, Indicator Words.

Saddness can be a Noun or a Logic Word.
The word “saddness” can be an Object.
When “saddness” is an object saddness is an
Adjective which is an Emotion. One can tell
if saddness is an Object and Emotion as
saddness can be felt in extremes. One can
die of saddness there for an Object and call
an Adjective. But one can not die of the
feeling of “saddness” when Saddness is a
Logic Word (as a gerund) or saddness as a
Verb, projected logic).

Presumptuous a Predominate Logic Word, a
 Logic Word and can be modified by a Verb:
 Happy Presumptuous creating a new feeling.
 One can not have a "Happy Many". "Many"
 a Protocol Object Word. Remember Nouns
 can become Gerunds which are Logic Words.
 Presumptuous is based on Nouns. External
 Logic. Protocol Logic Words are Internal
 Logic based on the Self's Logic. "Many" a
 Protocol Logic Word directs Language
 Objects (Nouns Logic Words) as well as Verbs.

Predominate Logic words are based on Nouns. Not sure how to explain this. The word “runner” is a Gerund. A Noun or Logic Word. “Running” is in the Family of “runner” and easily be seen as related to a Noun. We really only know “persumotuous” is a logic word because the word is an Experience. “Many” is almost just Logic of the self.

“Many” is a Basic Feeling, Feeling-Logic Object, a Plastic Consciousness Word in the Protocol Object Word Filter, which is in the Dynamic Filter Indicator Words. “Many” had to be deduced but once learnt does not change form. One can not describe “many” a Protocol Logic Object Word with a Verb. “Persumptuous Many”, does not work as Verb - Indicator Word. One can have Persumptuos Happy. Verb: Logic Word or Happy Persumotuous , again Verb: Logic Word. But can not have Verb: Indicator Word ... “Persumptious many”.

Recapping Verbs are project Logic Words. Or projected Experience. With this Plastic Consciousness. The word Truck can be used as a Verb. When the word Truck is used as a Verb the Verb is projects from a Gerund, a Logic Word. Logic Words can be projected as Verbs. Hense the word "Truck" can be a Verb as in A "truck like car". A "Noun like Noun". Becomes "A Verb like Noun". The

Noun “Truck” became a Gerund, a Logic Word then a Verb. Gerunds are in the Filter Compliant Logic Word.

Compound Nouns like “Armpit” is just a single Noun, Truckcar would also be a single Noun. With these two examples “Truck” and “Arm” are Verbs describing a Noun and also

creating a Noun. There is no Modification of Logic as in “Truck Like Car”. “Like” being a Logic Word.

The “Truck like Car” here the Target Word “Car” is Truck like, but still a car. In the description of Compound Noun “truckcar” we are not really sure what this means. The “truckcar” a kind of car. As is “armpit” is a kind of pit. As Truckcar is a Noun, The Noun can become a Logic Word and as the Logic Word can become a Verb, so here a “truckcar” can be a “Verb”, but that is another story.

When two Logic words are together the first word in the series transposes into a Verb. The logic of a Logic Word is “projected” and

becomes a Verb (a describing word) but when the the two Logic Object Words are seperated by Indicator Logic Word(s) the logic is modified. When there are more than two Logic Object Words in a row all the words before the Target Word, here a Logic Word, Logic Word become a Verb.

example: beautiful lovely appearence
dictation. Verb, Verb, Verb, Logic Word...
Beautiful, Lovely, and Appearence can all be
Logic Words.

A Logic Word Logic Phrase need an Protocol
Indicator word to make sense in a reality.
example: The beautiful lovely appearence
dictation. Protocol Indicator Word; Verb;
Verb; Verb: Logic Word.

The target Logic Word “dictation” is described by Verbs. Logic Words as Verb makes sense as a Logic Object Phrase. In this phrase the Verbs are describing the logic of “dictation”. "Dictation" is a word sound symbol denoting a Feeling and the Memory Object, and the word “dictation" is based in the Logic Word coral). The meaning is not changed by the Verbs but is enhanced. Verbs do not change logic but are an enhancement meaning of the logic of the word “dictation”.

To change the Logic of a Logic-Feeling Object Logic Word one has to connect the logic word with a Protocol Logic Object Word. (Modified Logic).

example: Dictation is blasphemy.

A Logic Phrase or Logic Word is where a experience is expressed. Logic Words and Phrases are experiences. Feeling is Logic. “dictation is blasphemy” has become a single peice of Basic Feeling and a Memory Object. A Feeling-Logic encapsulated by the Logic Word or Logic Phrase.

If you wanted to be silly the logic “dictation is blasphemy” could be called “dicblas” or any thing as the logic has been deduced into a new piece of Logic or Basic Feeling.

Maybe this process is how Logic Object Words are made. There are endless possibilites of Logic Words words that can be made. Most Logic Words or Logic Phrases are really facts in consciousness. Maybe Logic Words and Logic Phrases are what we have in common.

Verbs are external logic. Verbs are describing words. Verbs are the experience of a Logic Object Word or Logic Phase Projected. External Logic Object projected onto Nouns (external objects), and Logic Words (external) objects. (Language Objects). Logic Phrases are a form of Logic Words.

When Verbs are butted against each other they still only describe the Target Object. To redeem a Verb remove Verb in front from the Target Object will revert to a Logic Word. .

“Lovely beautiful.” to “Lovely” a Logic word. The word “Lovely” from Verb to Logic Word.

Basic Objects and Basic Feelings when remembered are called The Objects.

Memory Objects are Basic Objects>Objects
Objects and Basic Feelings>Feeling-Logic
Objects.

Memory Objects form the base of Words
and Language. We think in Memory Objects
and Memory Objects denote words.

The Basic Feeling circumvents the Object
Object from the path Basic>Basic
Object>Basic Feeling>Basic Object when the
base for a Logic Word and Verb.
